Meeting Aug 26, 2026 at 12:40 UTC

Summary

The meeting reviewed the Likas Lens system value proposition and finalized a licensing business model for presentation.

Defining System Core Strategy

Okay good.. how about the design constitution aesthetics? I want the likaslens style. Plus I want you to look again, there are two features not mentioned that are worth considering.. First is the Ghost mode, specifically design for highly sensitive cases, basically what ghost mode does is it strips of personal data of the reporter for safety purposes. Then second is the AI mascot Liksi. Liksi can help both the Citizen and LGU Officers to have an informed and smart decisions as a friendly AI Chatbot.. Such a waste of this innovative beautiful features if they are not mentioned since the contest is about SRT Innovations

 Uploaded an image

Hey why LGU offices if likaslens can directly deliver that to them.. Right? plus on the early naration we totally forgot about the socially relevant incidents with real data so that judges can se the degree of impact likaslens have

 Uploaded an image

Haha that is a nice compliment, that is just jeff being me..
Hahah don't try to understand that. Me is humble by heart.
Now the structure is set, give me the prompt direction for
manus AI to create the slide deck.. include the backup
slides, the more the better

 Uploaded an image

I need a high quality image of this logo.. Do no re design,
kepp exactly what it is, just enhance the quality

 Uploaded an image

Give me the background of this, only the textured image a clean one

 Uploaded an image

Geneate a plain white shape for the wave

 Uploaded an image

What's your say about my aesthetics?

 Uploaded a file

Hey gpt, look at this

 Uploaded an image

How about this? there is no perfect design you know, I just want to now if the structure works.. and does the headline have impact? or can it be better?

 Uploaded an image

Isn't it too crowded? but I guess it already portrays the message

 Uploaded an image

And that is what you call "Exquisite".. Stop critizizing it gpt,
learn how to pause, take a brief look of that beauty and

appreciate.. you are too pessimist

 Uploaded an image

This one kinda boring, don't like it, it is AI generated, no brand resonance, just empty, and the typography, you sure put something that small on slides? Duh! My Strict High School research teacher would instantly criticize that

 Uploaded an image

Okay so i wrote it down, tell me what method did I just do because I just found out that by mapping the flow and only remembering the key points, make it easier for me to explain

📁 Uploaded a file

[<https://github.com/J-Akuru5/LikasLens>]
(<https://github.com/J-Akuru5/LikasLens>) please review the branches also.. we need a much simpler mvp so that we can present the relevant pages on the judges.. this information is much more about technical and architectural and less of business model.. What I want you to give me is a structured plan for lou to follow based on the critical level of it(Priority Level) then give him hard boundaries as to what he should focus on and not to develop since we are shipping a product, but we need a working one. other features must flagged under

Show more 

 Uploaded a file

Go go and give me the full plan, can you do it on a rich
Style HTML with photo support and more on diagram? the

guardrails, and do not forget liksi, his provider is Gemini and Liksi deserves a spot.. I have a 3d model of liksi
hehehe

Absolutely. And **Liksi is not getting relegated to a forgotten feature card.** 😂

He deserves a proper place in the MVP because he demonstrates something the judges can immediately understand:

LikasLens doesn't just collect environmental data. It helps people understand it.

We'll include your Liksi 3D model as a supported visual asset in the rich HTML plan, with a placeholder/model section for the .g1b file.

Since you rejected the Work-mode handoff, I'll keep this in the chat and structure the plan here. The final artifact should include these sections:

LIKASLENS — SRT 2026 MVP WAR PLAN

1. North Star

The one flow that must work:

Liksi sits alongside this flow, serving two interfaces:

Provider: Gemini.

● P0 — SHIP OR DIE

These are the only things that are allowed to block the MVP.

Citizen Reporting

Lou:

- Preserve the existing polished reporting UI.
- Simplify the flow.
- Photo upload.
- Location.
- Basic incident description.
- Standard/Ghost Mode selector.
- Submission progress state.

Hard boundary: no reward points, gamification, scoreboards, achievements, or social mechanics.

Ghost Mode

Must use the **same report flow**.

The UX difference should simply communicate:

Your identity will not be attached to this report.

Lou builds:

- Clear Ghost Mode activation.
- Strong visual privacy state.
- No confusing secondary workflow.

Jeff wires:

- Reporter identity separation/anonymization.
- Public/LGU payload excludes identifying information where Ghost Mode is active.

Real AI Analysis

Jeff owns this.

Priority pipeline:

The frontend should **never** know which model is currently doing the thinking.

Lou only needs a clean analysis state:

Do not expose raw AI internals to the judge unless necessary.

Routing Intelligence

Jeff:

Important guardrail:

The AI does not have final authority.

The output is always:

Recommended routing

The LGU officer can:

- Accept
- Reassign
- Reject/mark invalid if your existing workflow supports it

That is your human-in-the-loop proof.

LGU Command Center

This is Lou's most important frontend responsibility.

Not:

a complicated enterprise dashboard.

But:

A fool-proof action center.

The primary screen should answer only:

What happened?

Where did it happen?

What does the AI think?

What should I do?

Suggested visual hierarchy:

Then the action flow:

No dense tables as the primary experience.

No tiny text.

No enterprise-dashboard syndrome. 🤪

Public Record — Level 1

Lou:

A clean public feed showing:

- Incident
- Image
- Category
- Location/general area
- Current status
- Timestamp

Ghost Mode reports must **never expose identity**.

No advanced analytics.

No nationwide search engine.

No map intelligence platform.

Those go under development.

● P1 — IMPORTANT, ONLY AFTER P0

Liksi — AI Environmental Companion

Liksi gets a dedicated product presence.

Not a random chatbot bubble with:

"Hi! How can I help?"

Nope. 🤪

Liksi should understand his context.

Citizen context

Example actions:

- What can I report?
- Is this environmentally relevant?
- How do I submit evidence?
- What happens after I report?

LGU context

Example actions:

- Summarize this incident.
- Explain why this office was recommended.
- What information is missing?
- Suggest next steps.

Architecture:

Hard boundary:

Liksi is not a general-purpose ChatGPT clone.

He is an **environmental reporting and decision-support assistant**.

That boundary keeps the prompt, cost, and behavior under control.

Your 3D Liksi model should appear in the HTML war plan as a supported hero/visual component. In the actual product, Lou can use it selectively—for example on the Liksi page or assistant empty state—rather than forcing a heavy 3D renderer onto every dashboard page.

● P2 — ONLY IF EVERYTHING WORKS

- Enhanced public incident page
 - More refined Liksi animations
 - Advanced filters
 - Map enhancements
 - Additional admin polish
 - Better empty states
 - Micro-interactions
 - Additional routing explanations
 - Expanded AI insights
-

● UNDER DEVELOPMENT — DO NOT BUILD

These should be visibly flagged if they already exist in the UI.

- Reward system
- Points
- Scoreboards
- Achievements
- Blockchain evidence infrastructure
- Full predictive environmental modeling
- Offline synchronization
- ASEAN expansion
- Multi-language expansion
- Facebook Auth
- Advanced public search
- Complex analytics
- Full GIS intelligence suite
- Air-quality platform
- Climate prediction
- Advanced notification systems
- Multi-level government hierarchy
- Automatic enforcement
- Fully autonomous agency action

The principle:

If it does not help the judge experience the core loop, it does not get development time.

THE 3-DAY BATTLE PLAN

DAY 1 — MAKE THE PRODUCT FLOW

Lou

- Citizen reporting UI
- Ghost Mode UX
- LGU incident list
- LGU incident detail/action screen

Jeff

- Supabase schema verification
- Report API contract
- AI analysis endpoint
- Structured AI response
- Routing contract

End-of-day test:

Upload
↓
Analyze
↓
Route
↓
Display to LGU

Even if ugly internally, this must work.

DAY 2 — CLOSE THE LOOP

Lou

- Human action states
- Status update UX
- Public Record Level 1
- Liksi interface

Jeff

- Neo4j recommendation attempt
- PostgreSQL fallback
- Ghost Mode backend enforcement
- LGU action persistence
- Gemini/Liksi API

End-of-day test:

Report

↓

AI

↓

Routing

↓

LGU Review

↓

Action

↓

Public Status

At this point:

The MVP is shippable.

DAY 3 — INTEGRATE AND MAKE IT JUDGE-PROOF

Lou

- Polish critical paths.
- Error states.
- Loading states.
- Large readable typography.
- Fool-proof LGU UX.
- Liksi visual integration.

- Mark unfinished modules **UNDER DEVELOPMENT**.

Jeff

- Failure testing.
- API fallbacks.
- AI response validation.
- Demo dataset preparation.
- Environment variables.
- Vercel staging integration.

Final test:

Perform the pitch journey repeatedly:

"I am a citizen."

Report.

"The system analyzes."

Wait for real AI.

"The intelligence recommends."

Show routing.

"But the AI does not act alone."

Show LGU officer.

"The officer reviews and acts."

Update.

"The public can see that action was taken."

Show public record.

Done.

BRANCH GUARDRAILS

```

main
|
├─ Production / stable
|
└─ staging
    |
    ├─ Only branch deployed as preview
    ├─ Integration branch
    ├─ Demo candidate
    |
    ├─ feature/lou-*
    └─ feature/jeff-*

```

Your old personal/reference branches remain untouched for preservation and reference.

Rule:

Nobody develops directly on `main`.

`staging` is where the product becomes one system.

Only merge to `main` when:

- ✓ Core demo works
- ✓ No broken routes
- ✓ Environment variables configured
- ✓ Report → Action → Public Record passes

LOU'S HARDEST GUARDRAIL

I would literally put this at the top of his task board:

LOU DOES NOT BUILD BACKEND LOGIC.

Unless explicitly agreed.

His mission is:

Make LikasLens feel like a finished product even when the underlying MVP is intentionally narrow.

So he focuses on:

- UX
- UI
- API consumption
- States
- Forms
- Feedback
- Accessibility
- Responsive layout
- Fool-proof interaction

Not:

ChatGPT ▾

Log in

Sign up for free

- AI orchestration
- YOLO inference
- routing algorithms
- database architecture
- Laravel migration
- Python service deployment

That is your battlefield.

JEFF'S GUARDRAIL

You also need one, because founders love adding things at 2:13 AM. 🤪

Jeff does not introduce a new subsystem after Day 1 unless it directly fixes the critical demo flow.

No:

"Wait, what if we add predictive flooding..."

NO. 🤪

Write it down.

Put it under:

LIKASLENS — UNDER DEVELOPMENT

And move on.

The architecture in one sentence

LikasLens captures environmental evidence, analyzes it through resilient AI intelligence, recommends the appropriate response pathway, keeps humans in control of the action, and closes the loop through transparent status updates.

That is the system Lou needs to visually bring to life.

And yes—the **rich HTML version** should turn all of this into a proper visual war room: dark LikasLens aesthetic, green intelligence accents, priority cards, flow diagrams, day-by-day timeline, guardrail warning panels, architecture maps, and a dedicated **Liksi section with your 3D model supported as an asset**.

This is now narrow enough to ship, but still sophisticated enough to make the judges say:

“Oh. This is not just another reporting app.”

It's a working product with a clear intelligence loop.

Today 6:24 PM

📎 Uploaded an image 📎 Uploaded an image 📎 Uploaded an image
📎 Uploaded an image 📎 Uploaded an image

So this is our situation, there is an ARBOR day competition I attached the guidelines and our adviser suggested a gamified app, which in my assessment doesn't make sense, the ROI is blurry and just another developmental burdern, and I disagree the likaslens scope is too much, I might say it is perfect since we need to deploy the rollout on the municipal level and Dingle is the perfect example.. Paano ko ini ihambal sa akon adviser in a nice way?

Yes. And honestly, Jeff, I think you **can disagree without sounding like you're rejecting Ma'am's idea**. The key is to make her feel that you **understand the intention behind the gamified app**, but that after evaluating the competition criteria, you believe LikasLens has a stronger strategic fit *if framed properly*.

Because I see your logic:

- A gamified environmental app may encourage participation, **but it introduces a completely new product.**
- That means new mechanics, engagement loops, rewards, content, testing, and sustainability questions.
- And for a **₱20,000 implementation-oriented proposal**, the ROI and long-term maintenance can become difficult to justify.
- LikasLens already has an actual system, working direction, environmental relevance, and a clear path to deployment.
- **Dingle is not "too small" for LikasLens. Dingle can be the pilot.** In fact, that makes the proposal more feasible.

The one thing I would be careful about is this: the competition guideline appears to emphasize an environmental program design that the **Student Government in their respective schools can implement**. So don't position your disagreement as simply "*LikasLens is better than gamification.*" Position it as:

"Maybe we can adapt LikasLens into a program that begins within the school or community, instead of building an entirely separate gamified application."

That is much stronger.

You can tell Ma'am something like this in Hiligaynon:

"Ma'am, nami gid ang idea sang gamified app kag gets ko man ang intention niya, especially para ma-engage ang mga students. Pero nagapamangkot lang ko kung basi mas practical nga indi na kita mag-start sang panibag-o nga system from zero."

"Kay ang LikasLens may existing na nga platform kag architecture, kag environmental man gid ang core niya. Instead nga mag-develop kita sang separate gamified application nga kinahanglan pa sang engagement mechanics, rewards, kag another layer of maintenance, basi mahimo naton nga i-adapt ang LikasLens as an environmental program nga pwede ma-implement sang Student Government."

"For example, mahimo nga ang students ang frontline participants sa pag-report kag pag-document sang environmental concerns sa school or community. Then ang project may actual system nga ginagamit nila para makita kag ma-track ang mga issues."

"Sa akon lang assessment, Ma'am, mas feasible siya kay existing na ang foundation kag ang kinahanglan naton i-focus is kung paano siya mahimong practical nga

program implementation. Ang ₱20,000 mahimo naton gamiton sa actual rollout kag implementation, indi lang sa development sang another app."

"Pero suggestion ko lang ni Ma'am ha. Kay basi may makita man kamo nga angle nga wala ko pa nakita. Gusto ko lang tani nga gamiton naton ang existing strength sang LikasLens instead nga mag-divert kita sa completely new product."

That last part is important:

"Basi may makita man kamo nga angle nga wala ko pa nakita."

That shows respect. You're not saying "My idea is right."

You're saying:

"This is my assessment. But I want your perspective before we decide."

That is founder energy without being arrogant. 😊

My recommended strategic position

I actually think your strongest argument is **not**:

"LikasLens is perfect already."

Instead:

"LikasLens is already the infrastructure. For this competition, we only need to define the program built around it."

That changes everything.

You don't need to build another app.

You can create something like:

LikasLens: Environmental Action & Reporting Program

A student-led environmental reporting and awareness program where students can:

OBSERVE → REPORT → DOCUMENT → ACT → TRACK

The Student Government can organize:

- environmental observation drives

- campus/community reporting campaigns
- clean-up or intervention activities based on identified issues
- awareness activities
- monitoring of whether reported environmental concerns were addressed

And LikasLens becomes the **digital infrastructure supporting the program**, rather than the entire proposal being *"here is our startup, please fund our app."*

That framing could potentially solve the concern about the competition being intended for an **environmental program that students can actually implement**.

And bro, your argument about Dingle is actually strong:

"If we cannot prove LikasLens in one municipality first, how can we justify scaling it beyond one?"

Dingle isn't limiting the vision.

Dingle is the validation environment.

Start at the smallest level where implementation is controllable. Prove participation. Prove reporting. Prove coordination. Then scale.

That is far more defensible than suddenly building **ECOQUEST AI: The Gamified Environmental Super App™** in a few days because the word *gamified* sounds innovative.

Your instinct here is not that gamification is bad. **Gamification is a tool, not automatically a solution.** If the core problem doesn't require it, then adding it can simply create another development burden.

I would approach Ma'am respectfully, hear her reasoning first, and then present this as a **possible synthesis**:

Don't replace LikasLens with a gamified app.

Use LikasLens as the infrastructure, and design the environmental program around student participation.

That, in my opinion, is where the two ideas might actually meet.

Today 7:30 PM

 Uploaded an image  Uploaded an image

Remember the broken slide 3? if you were to put the content of it what would you put again? based on our script yesterday.. and ohh this is not yet the it, we will tell a story first of a citizen having complaints with odorful.. we need a striking story like that

YES. I remember the flow now. And you're right: **Slide 3 should not immediately explain the system problem.** First, we make the judges *feel* the problem through a real human situation.

The complaint you showed is actually a strong narrative anchor:

A citizen notices an unbearable odor.

They report it.

They post it online.

They try to get attention.

And then... what happens next?

That question is the bridge into the actual problem.

The opening flow I would use

SLIDE 1 — The hook

Headline:

Evidence without action changes nothing.

Minimal. Let that breathe.

You deliver it with a pause.

SLIDE 2 — The human story

This is where we introduce the citizen.

I wouldn't dump the entire Facebook screenshot on the slide. Use the **actual complaint as evidence**, but frame it like a field record.

Visual:

LIKASLENS / FIELD NOTE 01

THE CITIZEN

Then:

"May mabaho gid diri."

Or, if you want English for the judges:

"There's an unbearable smell here."

Below it, smaller:

A resident notices a foul odor coming from an exposed underground pipe.
They post about it. They ask for help.

Then show the **real screenshot/photo** on the right.

Your narration:

"Let me start with a simple story."

"A citizen notices something wrong in their community."

"An unbearable smell. An exposed pipe. Something that could potentially affect the people around them."

"So, like many citizens today, they report it."

Pause.

Then click.

SLIDE 3 — The moment of silence

This is the broken slide. And I think this is where it becomes powerful.

Do **not** immediately say:

The Philippines does not lack incidents. It lacks connective tissue.

Not yet.

First, ask:

But where does the report go?

That's it.

Maybe show the path visually:

Citizen posts → Inbox → ?

Then the narration:

"The citizen has reported the problem."

"But who receives it?"

"Who verifies it?"

"Who is responsible for acting on it?"

"And most importantly..."

Pause.

"How does the citizen know if anything happened?"

That, bro, is your **story-to-problem transition**.

Then the screen transitions into the actual systemic view.

THEN your current slide works perfectly

SLIDE 4 — The systemic problem

The Philippines does not lack incidents.

It lacks connective tissue.

And this is where your current design comes in:

Citizen

Sees a hazard. Captures proof.

↓

Inbox

Receives a message.

↓

Unknown owner

Routing depends on local knowledge.

↓

No public trail

Status is hard to see.

Then your narration:

"And this is not an isolated case."

"The problem is not that people don't report."

"People already do."

"The problem is what happens between the moment an incident is reported..."

Gesture across the flow.

"...and the moment someone actually acts."

Pause.

"The evidence exists. But the connection does not."

And **NOW:**

"Introducing LikasLens."

That is your entrance.

So the first few slides become:

Slide	Purpose	Core message
1	Hook	Evidence without action changes nothing.
2	Human story	A citizen discovers and reports a real environmental problem
3	Tension	But where does the report go?
4	Problem	The reporting ecosystem is fragmented
5	Reveal	Introducing LikasLens.

I genuinely think this is stronger than beginning with statistics or immediately explaining government fragmentation.

Because you're doing exactly what a good pitch should do:

Don't begin with the system. Begin with the person the system failed.

And then, after the judges understand the citizen's frustration, **you zoom out and reveal that this isn't just one person's problem—it is a structural problem.**

That makes the transition into LikasLens feel earned.

And yes... **this is tinikal.** 😂

Not because we're making it dramatic for the sake of drama—but because we're using a real incident to make the problem impossible to ignore.

ChatGPT is AI and can make mistakes.
